**20ITL31 -DATA STRUCTURES LABORATORY**

Programme & Branch	B.Tech. & Information Technology	Sem.	Category	L	T	P	Credit
Prerequisites	Programming and Linear Data structures	3	PC	0	0	2	1
Preamble	This course provides practical exposure to develop applications using the concepts of Linear and Non-linear Data Structures.						

**List of Exercises / Experiments :**

1.	Perform the polynomial operations using linked list: i) Add $10x^5+2x^3-1$ to $8x^4-x^3+16x^2$ ii) Subtract $100x^4-19x^2-7x$ from $150x^3+8x-14$
2.	Implement a music player using appropriate data structure. The songs in music player are linked to previous and next song and the songs can be played either from starting or ending of the list.
3.	When multiple applications are running on a PC, it is common for the operating system to put the running applications on a list and then to cycle through them, giving each of them a slice of time to execute and then making them wait while the CPU is given to another application. When the operating system reaches the end of the list it can cycle around to the front of the list. Assist the operating system to perform the above operations using the appropriate data structure.
4.	a. Consider that you are given the following C program: <pre>void main() {     printf("KONGU");     if((a&gt;b)&amp;&amp;(a&gt;c)     printf(" a is greater than b and c"); }</pre> When the program is executed, the compiler reports an error "Missing parenthesis". Show how the compiler detects the error. b. Implement a Stack and Queue using Deque.
5.	a. Write a program to reverse the first k elements of a Queue. Example: Given Q = [10, 20, 30, 40, 50, 60, 70, 80, 90, 100] and k = 5. The output should be Q = [50, 40, 30, 20, 10, 60, 70, 80, 90, 100] b. Implement a program to check if the elements of a queue are pairwise consecutive.
6.	Implement a program with the criteria, every descendant node's value in the left subtree of n is less than the value of n and every descendant node's value in the right subtree is greater than the value of n
7.	Consider that the height of the student has to be maintained in a tree. The tree height must be balanced at all the time. Implement it with a suitable data structure.
8.	Given a File of N employee records with a set K of Keys(4-digit) which uniquely determine the records in file F. Assume that file F is maintained in memory by a Hash Table(HT) of m memory locations with L as the set of memory addresses (2-digit) of locations in HT. Let the keys in K and addresses in L are Integers. Design a program that uses Hash function H: $K \rightarrow L$ as $H(K)=K \bmod m$ (remainder method), and implement hashing technique to map a given key K to the address space L. Resolve the collision using linear probing.
9.	A person wants to visit some places. He starts from a vertex and then wants to visit every place connected to this vertex and so on. What traversal methodology suits best for him? Implement it using C.
10.	A person wants to visit some places. He starts from a vertex and then wants to visit every vertex till it finishes from one vertex, backtracks and then explore other vertex from same vertex. What traversal methodology suits best for him? Implement it using C.
